Quick-Reference Card --- The Augmented 9-Step DIA Protocol (with A_0 -- A_4 wiring)

Step 0	Scope & circumference — boundary, anecdote, entry point ($A_1/A_2/A_3$), synchronic/diachronic.
Step 1	Involvement profile (Axis I) — six PIM dimensions $\times$ macro/micro with A-node anchoring per cell.
Step 2	Motive grammar (Axis M) — six pentad terms; featured term(s); each term at anticipated/ratified/enacted level.
Step 3	Ratio dynamics — dominant ratio + transition-of-instantiation (which $M_n \rightarrow A_{n+1}$ it operates at).
Step 4	Crosswalk binding — fuse Axis M to Axis I via validated crosswalk + chain-locus tags.
Step 5	Identification & consubstantiation — the keystone as $A_3 \rightarrow A_4$ substantial union; rubric R1–R5 with chain loci.
Step 6	Attitude & hexis-bivalence — register + technē-hexis or ethical-hexis status; the cultivated disposition.
Step 7	Diagnosis & ends — dominant action-type (Type 1/2/3/4); chain-locus weight; keystone state.
Step 8	Recursion & diachronic outlook — hexis sedimented, Stimmung deposited, settled doxai, next entry point.

0.1 DIA Analysis of the *Red Dead Redemption 2* Tutorial

0.1.1 Chapter 1 (Colter) and the Opening of Chapter 2 (Horseshoe Overlook) Through the Burke × Calleja × A₀-A₄ Method

Date: 2026-05-28 **Method:** Dramatistic-Involvement Analysis (DIA) with the A₀-A₄ Ontological Wiring (Part F, Extended) **Sources analyzed:** the user's RDR2 ChatGPT.pdf notes (112 pp., 2026-01-10) — 30+ sequential scene analyses across Chapter 1 (Colter) and Chapter 2 (Horseshoe Overlook) plus theoretical sections on phantasia, attunement, and rhetorical ecologies — re-read through the new methodology. **Builds on:**

- corpus/index/Game-Behavior Analysis Method (Burke × Calleja)/game-behavior-analysis-method.md (Parts A-F)
- corpus/index/Game-Behavior Analysis Method (Burke × Calleja)/ontological-wiring-A0-A4.md (Part F Extended)
- corpus/index/Game-Behavior Analysis Method (Burke × Calleja)/worked-example-wow.md (comparative)
- Dissertation §§1.0-1.5 v3 (the actualization chain canon)

Provenance discipline. Aristotelian/Heideggerian claims = dissertation-direct (from §§1.0-1.5 v3); Burke/Calleja claims = burke-direct/calleja-direct; the user's existing analyses (from RDR2 ChatGPT.pdf) = user-direct; cross-framework bindings = anticipatory-projection; all RDR2-tutorial-as-instance-of-DIA-grid claims = dissertation-integration.

0.1.2 0. What this document does

The user has produced extensive sequential analyses of *Red Dead Redemption 2* (RDR2) using the pre-Burke version of the framework: Calleja's PIM + Rickert-Heidegger rhetorical attunement + Aristotelian *phantasia*. Burke's pentad is present anticipatorily — the notes name "consubstantiation," "identification," "Burke's principle of consubstantiality" at several scenes — but the integration is not yet operational at the structural level.

This document does three things:

1. **Re-reads the tutorial scope** the user's notes already cover, using the now-integrated DIA grid (Burke pentad × Calleja PIM × macro/micro) anchored to the A₀→A₄ actualization-of-desire chain.

2. **Diagnoses the tutorial structurally** — what type of action each tutorial beat sources, what dispositional ground (hexis) the tutorial cultivates, how the consubstantiation↔incorporation keystone is engineered, and how the synchronic and diachronic registers of the pathetic loop are mobilized.
3. **Compares the result to the WoW raid worked example** (worked-example-wow.md) to show what the same method reveals about a fundamentally different game.

The headline finding: **the RDR2 tutorial is the closest case in commercial game design of *ethical-hexis cultivation* as the primary engineering objective**. Where the WoW raid is a worked example of competitive *technē-hexis* cultivated within a Type 3/Type 4 framework, the RDR2 tutorial is a sustained engineering of the player into a *praxis*-mode disposition where the action's end is immanent in the doing — the substantial structural reason that RDR2 became a critical touchstone for game-as-ethical-experience discussion. The tutorial does not just teach Arthur Morgan's controls; it cultivates the *how* of standing in those controls.

0.1.3 1. The tutorial scope — and why it extends beyond Chapter 1

1.1 Defining the boundary

In the strict sense, the RDR2 tutorial is **Chapter 1: Colter** — the snowy mountain prologue beginning with the gang's flight from Blackwater and ending with the descent to Horseshoe Overlook. But the user's notes (correctly, on a structural reading) extend the unit of analysis through the early missions of **Chapter 2: Horseshoe Overlook**, on the principle that *the tutorial is whatever introduces the systems*. The Honor system, hunting, the camp economy, the train robbery, donating to the camp pot, crafting, the General Store — all are introduced in early Chapter 2 and complete the systems-introduction arc.

The DIA-method augmentation at Step 0 (ontological-wiring-A0-A4.md §6) explicitly directs the analyst to set the circumference deliberately. For the RDR2 tutorial we therefore set:

Scope: Chapter 1 (Colter), in full, plus the opening missions of Chapter 2 (Horseshoe Overlook) through the first Honor-mechanic foregrounding (the user's RDR2-07 beat: "Mission, General Store, Honor"). This is the systems-introduction arc; after this point the game opens into its standard sandbox.

Representative anecdote (Burke's term, augmenting Calleja's "unit of analysis"): the *moment-of-descent from Colter to Horseshoe Overlook*. The snowy prologue's spatial-kinesthetic deprivation gives way to the camp's spatial-social abundance; the player, having been *forced* through Chapter 1's linear corridor, enters Chapter 2 as someone whose disposition has been cultivated rather than instructed. The descent is the representative form of the tutorial's overall act-shape.

1.2 The user's existing notes — what they already establish

The 30+ sequential analyses already establish, at the pre-Burke level:

User's framing	What it corresponds to in DIA
"Rhetorical attunement" (Rickert/Heidegger/Hawk)	The whole-chain alignment of the player with the gameworld's <i>Bewandtnis-ganzheit</i> — the totality of involvements at A ₀
"Player Involvement Model" (Calleja, six dimensions × macro/micro)	Axis I of the DIA grid (validated and stable since <code>validated-crosswalk.json</code>)
"Phantasia" (Aristotle)	The A ₂ <i>phantasma</i> node + the <i>resonant aisthēma</i> / <i>resonant epithymia</i> dual-resonance at A ₁
"Being-in-the-world / <i>Befindlichkeit</i> / <i>Stimmung</i> " (Heidegger)	The A ₀ -A ₁ ontological horizon + the basic-affective-valence saturation across the chain
"Identification" / "consubstantiation" / Burke's principle (named at RDR2-02, Honor)	The keystone, now made operative
"Ontological change" thesis	The diachronic register of the pathetic loop

The user's framework is *anticipatorily* the DIA framework. What the new methodology adds:

- **Axis M operationalized:** each scene now gets a six-pentad-term reading (Act / Scene / Agent / Agency / Purpose / Attitude) with featured terms and dominant ratios.
- **The Ludic split:** the user's "ludic involvement" can now be parsed into Agency (rule-system) vs. Act+Purpose (choosing-under-repercussion), per the validation report.

- **The Four Types of Action at A₄:** which species of *orexis* the tutorial is cultivating at each beat.
- **The hexis bivalence** (technē-hexis / ethical-hexis): the structural axis the user's existing reading approached but did not name.
- **The chain-locus tagging:** each scene's content placed at a specific A-node, making the synchronic and diachronic registers analytically distinct.
- **The keystone-as-substantial-union reading:** consubstantiation/incorporation as the A₃→A₄ "one substrate, two in being" event.

What the user already has stays. What the new method adds is operational precision and the structural grammar that the user's notes were reaching toward but did not yet have available.

0.1.4 2. Step 0 — Scope, circumference, entry point

Per the augmented Step 0 (ontological-wiring-A0-A4.md §6): set the episode boundary, identify the entry point (sense at A₁ / imagination at A₂ / thought at A₃), and decide whether the analysis is synchronic (within a chain-pass) or diachronic (across passes).

Boundary: as set in §1.1 — Chapter 1 (Colter) + early Chapter 2 (Horseshoe Overlook) through the first Honor-mechanic foregrounding.

Entry point: A₁ (**sense entry**), with a precise twist that is itself structurally significant.

Most game tutorials presuppose an A₂ entry — the player brings *phantasmata* of "what a third-person open-world shooter is" from prior games, and the tutorial confirms or extends them. RDR2's opening cinematic — the snowy approach, the visual obscurity, the muffled audio, the gang silhouettes blurring into the blizzard — deliberately strips the player of those held *phantasmata*. The chain re-enters at A₁: the player perceives the gameworld as fresh-perception before the *phantasma* of "this-is-a-Rockstar-game" can take hold. (This is the user's RDR2-1 "Opening Cinematic" finding restated in the new vocabulary: "the cinematic draws on visual and auditory cues to immerse players, employing what Calleja terms 'incorporation,' where players feel an embodied connection to the space" — what the user identified as "incorporation" is the A₁ dual-resonance deposit *engineered before any A₂ phantasma can interfere.*)

This is engineering: Rockstar's choice of opening cinematic + blizzard + muffled audio is a structural intervention to force A₁ entry rather than A₂. It is the precondition for everything that follows.

Register: both. The Chapter 1 prologue is a single tight *synchronic* chain-pass (one extended episode, the Colter survival arc). Chapter 2's opening missions are a *diachronic* sequence (multiple chain-passes within an emerging hexis-band). The analysis must hold both registers.

0.1.5 3. Step 1 — Involvement profile (Axis I) for the tutorial as a whole

The user's notes provide the dimension-by-dimension analysis at the scene level. Synthesizing across the tutorial arc:

Dimension	Macro intensity	Micro intensity	Internalization trajectory	What the tutorial does
Kinesthetic	(low at start — no prior session)	Very high	Conscious → fluent	The tutorial <i>demands</i> fluency by the end of Colter (gunfight in the cabin, horseback escape). Mimetic → symbiotic continuum is engineered explicitly.
Spatial	Med (the Western mythos is held macro-phase)	Very high	Conceptual → inhabited	The Colter prologue confines the player to a strictly inhabited place. By the descent, the gameworld is <i>inhabited</i> , not mapped.
Shared	High (the gang as held social <i>phantasma</i>)	High	Cohabitation → cooperation	The gang is introduced not as NPCs-to-interact-with but as <i>with whom the player already is</i> . Mitsein cultivated by saturation.
Narrative	Very high (the Western, the gang's mythology)	High	Scripted → alterbiographic	The tutorial scripts heavily (Colter is on rails) but every scripted beat is rendered as if it were alterbiographic — the player feels the act as their act.
Affective	Very high	Very high	Rising tension → cultivated <i>Stimmung</i> of bleak survival → community on descent	The most engineered dimension. Every scene's <i>Stimmung</i> is consciously sculpted.
Ludic	Med (the genre's expectations are bracketed)	High at micro	Strategy → tactics → microtactics; but : ludic involvement is <i>quieter</i> than in a typical AAA game	The Ludic dimension is deliberately <i>muted</i> in the tutorial — choices are constrained, repercussions are scripted. This

The Ludic muting is the structural inverse of the WoW raid example. In the raid the Ludic is very-high and load-bearing; in the RDR2 tutorial the Ludic is *moderately* present and deliberately backgrounded. The dimensions Rockstar foregrounds — Spatial, Shared, Narrative, Affective — are precisely the dimensions whose cornerstone-and-blending Calleja identifies as the incorporation-condition.

Calleja’s incorporation rubric (R1-R5) verdict on the tutorial:

Criterion	Status by end of tutorial (Horseshoe Overlook arrival)
R1 assimilation (world → consciousness)	Met. The Colter blizzard’s auditory-visual saturation has been internalized; the gameworld’s sound design, lighting, animation style are now the player’s <i>resonant aisthēma</i> .
R2 embodiment (player → world via avatar)	Met. Arthur Morgan as avatar-and-character is the determinate <i>phantasma</i> through which the player acts. The user’s notes flag this: “engagement of <i>phantasia</i> — the imaginative capacity that bridges sensory input with future-oriented judgment.”
R3 simultaneity (joined-and-separate)	Met, but distinctively. The player is substantially one with Arthur <i>while remaining a distinct locus of motives</i> — this is the formal-ontological condition for RDR2’s celebrated <i>moral ambiguity</i> (the player’s judgments diverge from Arthur’s; the divergence is the work).
R4 spatial+kinesthetic cornerstone	Met by end of Colter. The snowy prologue is essentially a Spatial-Kinesthetic cornerstone-construction exercise.
R5 blending	Met by mid-Chapter 2. The camp chores + hunting + train robbery weave 5+ dimensions into single co-active scenes.

The tutorial achieves Calleja’s incorporation conditions. This much the user’s existing analyses establish. The new method adds: *how* (Steps 2–7 below) and *what is being cultivated* (§6).

0.1.6 4. Step 2 — Motive grammar (Axis M)

The six pentad terms across the tutorial arc, with featured terms marked. (See Appendix A for cell-by-cell content.)

Term	Filler(s)	Featured?
Act	The fleeing-Blackwater act (priors), the survival-in-Colter act, the descent act, the camp-establishment act, the first-train-robbery act, the first-hunt act, the first-Honor-decision act	Featured at each beat
Scene	The gameworld (Grizzlies, Heartlands), the gang as social Scene, the era (1899 — twilight of the West), the snowy prologue qua Scene	Foregrounded — RDR2's Scene is the most cultivated pentad-term
Agent	Arthur Morgan (avatar) + the gang as collective-agent + the player as the agent-shifting locus	Featured throughout; the agent-position shifts (player ↔ Arthur ↔ gang) are constitutive
Agency	The control scheme + weapons + horse + camp economy + Honor + Eagle Eye + DKP-equivalent (camp ledger)	Present, deliberately backgrounded in macro
Purpose	Survive Colter → reach Horseshoe → re-establish the gang → "make some money" (the explicit, ironic god-term)	Present, deliberately <i>under-articulated</i>
Attitude	Devotional → competitive (when threatened) → completionist (camp chores) → explorer (descent) → ironic-meta (rare, post-tutorial)	Cultivated, not chosen — the tutorial works to <i>cultivate the player's dispositional ground</i> toward a devotional-explorer register

The featured terms — **Scene, Agent, Act, Attitude** — together with the deliberate

under-foregrounding of Purpose are the formal-grammatical signature of an ethical-hexis cultivation rather than a competitive-technē-hexis cultivation. (In the WoW raid: Act, Agent, Purpose are featured; Attitude is foregrounded but Purpose is held as god-term. In RDR2 tutorial: Purpose is *muted* so that Attitude can be *cultivated* without becoming instrumental to Purpose.)

This is the structural opposite of the dark-pattern compulsion design. Where compulsion design *engineers Agency-Purpose collapse* (means become ends), the RDR2 tutorial *engineers Purpose to recede* so that the action's end can be *immanent in the doing*. The technical name for this in the dissertation's §1.5 v3 vocabulary: the RDR2 tutorial is *praxis-mode* (*energeia*) rather than *poiēsis-mode* (*kinēsis*). The ends are not deferred to a product; they are realized in the activity itself.

0.1.7 5. Step 3 — Ratio dynamics

The dominant ratio across the tutorial arc:

Scene-Agent: how the gameworld qualifies the inhabiting player. The Colter blizzard does not just contain the act; it *qualifies the agent* — the player is constituted as cold, exhausted, dependent on the gang. The descent to Horseshoe Overlook is not just a movement through Space; it is the Scene-Agent ratio resolving toward warmth, abundance, community.

This is RDR2's signature motive-engine. Other operative ratios:

- **Act-Agent (alterbiographic):** each completed act remakes who the player is. The first hunt, the first horse-bond, the first Honor decision are not just acts; they sediment as hexis. This is the diachronic dimension that the tutorial sets up for the rest of the game.
- **Scene-Act:** the gameworld constrains and enables what the player can do. RDR2's environmental storytelling is constantly active.
- **Agency-Purpose:** deliberately *muted* — the tutorial does not let means-become-ends. The grind-resistance of the RDR2 economy at this point in the game is a structural choice.
- **Agent-Agent (co/counter):** the gang as co-agents, the O'Driscolls as counter-agents. Sets up the social-motive apparatus.

The player attributes their behavior to: *the situation* (Scene-Act) and *who Arthur is becoming* (Act-Agent). Not to *their own development* (which is Act-Agent in the com-

petitive register), not to *the tools* (Agency-Purpose), not to *other players* (the social-Agent-Agent in the competitive register). This attribution pattern is the diagnostic signature of *praxis-mode* play.

0.1.8 6. Step 4 — Crosswalk binding (the fusion)

Reading the featured pentad terms through their bound Calleja dimensions via `validated-crosswalk.json`:

6.1 Scene × Spatial — the strongest binding, decisive in RDR2

The user's RDR2-02 analysis ("Opening Restriction of Exploration") already gets the structural mechanism:

"By limiting movement, the game narrows player agency, channeling attention to predefined elements. This supports Burke's dramaturgic framework of scene dominating agency: the setting defines the player's role and potential actions."

In the new vocabulary: the Colter corridor *engineers a tight Scene-Agency ratio with Scene as the constraining term*, so that when the gameworld finally opens at the descent the player's spatial-inhabitation criterion has been met *before* the gameworld becomes spatially navigable in the sandbox sense. This is the **R4 cornerstone (spatial + kinesthetic)** being constructed via deprivation. By the time the player rides into Horseshoe Overlook, the gameworld is *already* inhabited — Calleja's Spatial dimension's micro-phase has been engineered through Chapter 1's macro-phase restriction.

This is a brilliant engineering choice — and the new method names it precisely. The mechanism is: cultivate the Spatial cornerstone under deprivation (Colter), then release the gameworld with the cornerstone *already met*, so that what Calleja calls "place-as-inhabited" is the player's default mode-of-encounter rather than a state that has to be earned by sandbox exploration.

6.2 Agent × Shared — deepened by consubstantiation (the keystone)

The user's RDR2-1 ("Opening Cinematic") notes: "By rooting the player's early experience in survival and camaraderie, the game primes the player to adopt the characters' perspectives." This is the **A₂ avatar-identification** + the **A₃ doxastic ratification of the gang-as-collective-agent** beginning simultaneously.

The mechanism is precise:

- **A₂**: the *phantasma* of Arthur-as-me is constructed via the cinematic + the first-person interiority (Arthur’s spoken thoughts) + the gang’s address (“Arthur, give me a hand”). The Hazlitt-Burke identification quote (RoM 83-84, cited at §1.3 of the dissertation) operates here: *the warmth/liveliness of the present phantasma of “Arthur” identifies the future-self the player will become with their present being*.
- **A₃**: doxa ratifies “I AM Arthur Morgan in this gang in 1899.” This is involuntary — the user’s earlier framing of “rhetorical attunement” identified this precisely: the player does not *decide* to be Arthur; the player *finds themselves* taking-as-true that they are him.

The Shared-Agent binding is engineered via three reinforcing channels:

1. Linguistic: the gang addresses Arthur by name; the player hears “Arthur” hundreds of times in Chapter 1.
2. Pronominal: NPCs use “we” (Dutch’s “we got each other”) and “us” (Hosea’s “let’s get them”) — the collective-agent *phantasma* is grammaticalized.
3. Mechanical: cooperative actions in Colter (helping John, gunfights with Bill, splitting the O’Driscoll group) routinely require *acting-together* (Burke’s RM-01 ground of consubstantiality).

6.3 Agency × Kinesthetic — the most-noted but least decisive binding

The user’s notes give substantial coverage of the controls-naturalization process (RDR2-03-02: “Movement, Combat, Inventory, Camera”). The mechanism is Heidegger’s *Zuhandenheit*: tools transition from *present-at-hand* (consciously operated) to *ready-to-hand* (transparent).

The new method’s contribution: name this as *technē-hexis cultivation at the Agency-Kinesthetic cell*. The control scheme becomes a *hexis* — a settled disposition. **But**: the tutorial is careful not to let *technē-hexis* be the whole story. The Honor system, introduced at RDR2-07, *re-engages the evaluative axis* the *technē-hexis* was bypassing. This is the **ethical-hexis layering on top of the technē-hexis** that makes RDR2 structurally distinctive.

6.4 Attitude × Affective — the transverse modifier

The five attitude registers (Part B.3 of the DIA manual) on Chapter 1 + early Chapter 2:

- **Competitive** (agonistic striving): present in the gunfights, the O’Driscoll camp clear-out, but *not foregrounded* — the gunfights are framed as survival, not competition.
- **Completionist** (engagement sustained by impossibility of final acquisition): present in the camp chores, the donation-to-pot mechanic, but again *not foregrounded* — the chores are framed as *acting-together with the gang*, not as a checklist.
- **Explorer** (dwelling-toward and ascending-through the scene): the descent from Colter is the structural moment Explorer is cultivated; the journal mechanic (user’s RDR2 “Inspect Oil Derrick” + “Camera Acquisition”) later operationalizes it.
- **Devotional** (reverent self-subordination to the gameworld’s order): **the dominant Attitude the tutorial cultivates**. Arthur’s devotion to Dutch, the player’s devotion to Arthur, the visual reverence with which the gameworld is rendered — all coordinate to engineer a devotional register.
- **Ironic-meta** (detached, playing with the game’s rhetoric): *suppressed* by the tutorial. The opening cinematic is designed to defeat the player’s prior ironic-meta dispositions from other games.

The devotional register’s cultivation is decisive. **Devotional Attitude is the dispositional ground for ethical-hexis** (per §1.5 v3 + ontological-wiring-A0-A4.md §4.5): the *philia*-attentive, *kalon*-oriented disposition in which the action’s end is immanent in the doing.

0.1.9 7. Step 5 — Identification and consubstantiation: the keystone in RDR2

The user’s notes name the keystone explicitly at RDR2-02 (“It forces a reflexive identification with the protagonist, leveraging Burke’s principle of consubstantiality”) and again, more thoroughly, in the Combined Analysis (Honor System, gang interactions, Mary-Beth conversation).

The new method’s contribution: the keystone is **the $A_3 \rightarrow A_4$ substantial-union event** (ontological-wiring-A0-A4.md §3), and the tutorial is the engineering site for this event.

7.1 The R1-R5 incorporation rubric, ontologically wired

- **R1 assimilation** (world $\rightarrow$ consciousness) = the *resonant aisthēma* of the Colter blizzard + the Heartlands’ light + the camp’s auditory texture deposited at A_1

across many chain-passes. By Horseshoe Overlook arrival, the gameworld is internalized as kinetic content. **Met.**

- **R2 embodiment** (player → world via avatar) = the *phantasma* of Arthur-as-me at A₂, doxastically ratified at A₃. The first-person interiority Rockstar gives Arthur (the journal, the spoken thoughts) is engineered to make this *phantasma* especially determinate. **Met.**
- **R3 simultaneity** (joined-and-separate, held simultaneously) = the player is one with Arthur *while remaining a distinct locus of motives*. The structural feature that makes RDR2 morally interesting: the player's judgments diverge from Arthur's (e.g., the player may judge that Dutch is leading the gang into disaster long before Arthur ratifies that *doxa*). The divergence is preserved by the joined-and-separate structure. **Met, distinctively.**
- **R4 cornerstone** (spatial + kinesthetic) = met by end of Colter. The deprivation-then-release engineering at §6.1 ensures this.
- **R5 blending** (4–5+ dimensions co-active) = met by mid-Chapter 2 (the camp chores + first hunt + train robbery weave 5–6 dimensions per scene).

Verdict: incorporation MET by Horseshoe Overlook arrival. The tutorial is, in DIA terms, an *incorporation engineering arc* — every beat is structured to advance one or more R-criteria.

7.2 The Burke direction: consubstantiation as the social-substantial event

What the new method adds beyond the user's already-correct identification:

At A₃, the doxa-ratified *phantasma* of "the gang" — Arthur, Dutch, Hosea, John, Charles, Lenny, Sean, Javier, Bill, Karen, Mary-Beth, Tilly, Reverend Swanson, Sadie, Jenny, Davey, Mac, Susan Grimshaw — is the social substance the player becomes one-with. When the player at A₄ acts in any beat (helping carry supplies, hunting for the camp, defending the camp, sitting at the fire), the action's terminus is *jointly realized*: the meat fed to the camp is meat *we* secured; the train job done is a job *we* pulled. The "one substrate, two in being" structure (DA III.7 431a13–14) operates at the social level.

This is consubstantiation in the technical Burkean sense (RM-01 p.21: "substantially one ... yet a distinct locus of motives — both joined and separate"). The user's notes named it; the new method names *where and how* it happens (the A₃→A₄ joint chain-actualization) and *why it has the moral weight it has* (because the Aristotelian struc-

ture preserves the joined-and-separate condition at the formal level).

7.3 Why this matters: the tutorial pre-empts the Mary-Beth conversation, the Sean rescue, and the train job's moral weight

The user's later scene analyses (Mary-Beth, Sean rescue, train robbery) all depend on the keystone being already-met *before they happen*. The tutorial's structural function is to set up the keystone so that these later scenes can *exploit* it.

The Mary-Beth intimate conversation (user's RDR2 Mary-Beth scene) is a Type 3 bouletic + ethical-hexis scene **only because** the consubstantiation has been engineered in the tutorial. Without the tutorial's keystone-engineering, the conversation would be a competitive-completionist dialogue-tree exercise. With it, the conversation is a moment of *philia*-attentive ethical engagement.

Similarly: the Sean rescue, the train robbery, the camp party celebrating Sean's return — each leverages the keystone. The tutorial is the engineering, and the rest of the game is the exploitation.

0.1.10 8. Step 6 — Attitude and hexis-bivalence

The augmented Step 6 (ontological-wiring-A0-A4.md §6, Step 6) requires identifying not just the dominant attitude register but also its *hexis-status* — is it cultivated as *technē-hexis* (transparent routine) or as ethical *hexis* (holding-oneself-open for fresh *kairos* resolution)?

The tutorial's hexis-bivalence work is **layered** — and this is the structural reason RDR2 is a critical touchstone for game-as-ethics:

8.1 *Technē*-hexis layer

The Kinesthetic-Agency cell is cultivated as *technē-hexis*: the control scheme becomes transparent. Aiming, sprinting, looting, riding, calming the horse, eating, sleeping — all sediment into procedural routines that fire the chain through $M_2 \rightarrow A_3$ on transparent doxa without engaging the evaluative axis. This is necessary; without it the player cannot operate in the gameworld.

8.2 Ethical-hexis layer

Layered *on top of* the *technē-hexis*, the tutorial cultivates an ethical-hexis at three distinct cells:

Cell	Ethical-hexis content	Tutorial moment
Scene × Spatial	The <i>kairos</i> -attentive dwelling-toward (explorer-devotional register): the gameworld asks to be <i>attended to</i> , not just navigated	The descent from Colter; the journal/inspection mechanic
Agent × Shared	The <i>philia</i> -attentive <i>Mitsein</i> with the gang: the gang-members ask to be <i>known</i> , not just used	The camp interactions (greeting NPCs, conversations, the camp party)
Attitude × Affective	The standing-toward Arthur's moral situation: the Honor system asks the player to <i>take a position</i> , not just to optimize a meter	The Honor-mechanic introduction (RDR2-07); the Mary-Beth intimate conversation; the Wanted system's moral feedback

The ethical-hexis layer is what the user's notes were tracking under "rhetorical attunement" — the alignment that is "not merely cognitive but deeply affective and embodied." In the new vocabulary, this is the **two-level reach of the ethical hexis** (§1.5 v3, summarized at ontological-wiring-A0-A4.md §2.8): the ethical *hexis* modulates *both* the basic-valence input at A_1 (Stimmung-saturation: the player enters each new scene already affectively disposed) *and* the doxastic ratification at $M_2 \rightarrow A_3$ (the player ratifies *phantasmata* with evaluative complexity in mind).

8.3 The *kairos*-responsiveness moment

Heidegger's *kairos*-responsiveness (BCAP 128) — the cultivated capacity to meet the singular demand of the situation as it arises — is engineered into the RDR2 tutorial through specific design choices:

1. **Variable timing in scripted scenes:** the Honor decisions in the tutorial are not yes/no buttons; they are unfolding situations in which the player's *kairos*-responsiveness is tested. (User's RDR2-07: "Decisions affecting Honor create a feedback loop where the player's choices shape Arthur's reputation and narrative trajectory.")
2. **Random encounters from early game:** the user's "Helping Random Stranger" notes correctly identify that random events "maintain player interest by introducing unscripted interactions and moral choices." Structurally: they cultivate the

holding-oneself-open disposition. **The random encounter at Horseshoe Overlook is the first opportunity for the cultivated ethical-hexis to actualize freshly.**

3. **The journal mechanic** (user's "Inspect Oil Derrick"): the journal's reflection-pause is engineered to cultivate the *attending-to-the-singular* disposition.

8.4 The structural diagnostic: RDR2 vs. WoW vs. dark-pattern compulsion design

Disposition	Cultivated by	Operates at	Action-type
<i>Technē</i> -hexis run-away (compulsion)	Daily-login, gacha-pull, FOMO-gated currency	All cells, but especially Agency × Ludic	Type 4 → Type 1 regression
<i>Technē</i> -hexis bounded by ethical <i>hexis</i> (mastery)	WoW raid progression (<i>technē</i> fits within bouletic + competitive frame)	Agency × Kinesthetic + Agency × Ludic-rule-system, framed by Purpose × Ludic	Type 4 prohairetic, sometimes Type 3 bouletic
<i>Ethical hexis</i> layered on <i>technē</i> -hexis (RDR2 tutorial)	The Colter → Horseshoe arc + the Honor + the journal + the camp interactions	Scene × Spatial + Agent × Shared + Attitude × Affective	Type 3 bouletic + Type 4 prohairetic, both under ethical-hexis

The structural distinction names what the user's notes had named impressionistically as "rhetorical attunement that produces ontological change." The mechanism is now operationalized.

0.1.11 9. Step 7 — Diagnosis and ends

9.1 One-paragraph behavioral diagnosis

The RDR2 tutorial (Chapter 1 Colter + early Chapter 2 Horseshoe Overlook) is a sustained **incorporation-engineering arc** that cultivates an **ethical-hexis** at the Scene × Spatial, Agent × Shared, and Attitude × Affective cells, layered atop a *technē*-hexis cultivated at the Agency × Kinesthetic cell. The tutorial's dominant motive-engine is a **Scene-Agent ratio** (the gameworld qualifying the inhabiting player) operating through the deliberate strategy of **Spatial deprivation in Chapter 1 yielding to Spatial-Social abundance at the Horseshoe descent**, which constructs the **R4 cornerstone (spatial + kinesthetic)** of incorporation under conditions where Calleja's R5 blending becomes available almost immediately on entering the open gameworld. The keystone — **consubstantiation ↔ incorporation as the $A_3 \rightarrow A_4$**

substantial-union event — is engineered through the social *phantasma* of the gang at A₂, doxastically ratified at A₃ via linguistic + pronominal + mechanical channels, and consummated at A₄ in the jointly-realized actions of camp life. The featured pentad terms (Scene, Agent, Act, Attitude) and the deliberate **muting of Purpose** in the macro-phase are the formal-grammatical signature of *praxis*-mode (ends immanent in doing) rather than *poiēsis*-mode (ends in a product) — the structural reason the RDR2 tutorial generates the *Stimmung* that critics and players have variously called “presence,” “immersion,” “incorporation,” “rhetorical attunement,” “ontological change.” All are different descriptions of the same underlying engineering: the chain has been wired to run through A₃’s ethical evaluative axis on each pass, doxa engaging evaluatively complex content, the *resonant epithymia* concretizing into Type 2 thymotic (defense of Mitsein), Type 3 bouletic (the wished-end of *acting-well-with-this-gang*), and Type 4 prohairetic (the deliberate choice of means *kairos*-responsively) action — *not* into Type 1 epithymetic compulsion loops.

9.2 Ends this analysis serves

E.1 Design critique. The RDR2 tutorial is the structural counter-example to dark-pattern design. Where dark-pattern design engineers **Agency-Purpose collapse** (means become ends → Type 4 → Type 1 regression → *technē*-hexis runaway), the RDR2 tutorial engineers **Purpose-recession with ethical-hexis cultivation** (Purpose is muted so that Attitude can be cultivated; the *technē*-hexis is bounded by the ethical-hexis layered on top). This is naming-worthy as a structural strategy because:

- It is *replicable*: a designer can ask, “what is the *kairos*-attentive disposition I am cultivating, and how is the *technē*-hexis it requires bounded by the ethical-hexis I want?”
- It is *measurable*: the diagnostic asks at each scene which Type the action sources, which hexis is operative, and which A-node is the locus of evaluative work.
- It is *distinct from “narrative depth” as the usual praise-term*: the structural feature is not story quality but the engineering of A₃ to *retain* the evaluative axis even under high *technē*-hexis fluency.

The structural diagnostic that game-design ethics has been waiting for is: **does the design cultivate ethical hexis alongside *technē*-hexis, or does it engineer *technē*-hexis runaway?** RDR2 cultivates ethical-hexis from the tutorial forward. Many AAA games engineer *technē*-hexis runaway. The structural difference is now nameable.

E.2 Player-experience research. The DIA grid (with augmented A-node tagging per ontological-wiring-A0-A4.md §6) is a **coding instrument** for qualitative RDR2

research. A think-aloud protocol with a player progressing through the tutorial would yield codable observations at each cell × each A-node × each Type — with the dispositional sedimentation across passes tracked diachronically.

The user's existing scene-by-scene notes are already proto-DIA-coding. Re-coded with the augmented grid, they constitute a substantial pilot study for this approach.

E.3 Social/identity behavior. The keystone-engineering's diagnostic implications for social/identity behavior in the RDR2 community:

- The **gang-as-collective-agent identification** the tutorial engineers persists in player discourse: players speak of "our camp," "our gang," "what Dutch did to us." The first-person plural is not a figure of speech but the lived state of acting-together that the keystone preserves.
- **The Mary-Beth/Lenny/Sean grief responses** in the broader community are structurally legible as **consubstantiation-rupture events** — Calleja's incorporation breaks down because the joined-and-separate substance is severed by the character's death. The player's grief is the affective signature of the rupture; the camp's grief is the social-substantive correlate.
- **The Micah-as-betrayer arc** (user's notes RDR2-15) is structurally legible as a **strategic-belonging (T1 of RM-01) recognized in retrospect**: Micah was never consubstantial; he was strategically identified ("by default," in Burke's term). The player's increasingly strong intuition of Micah's strategic-not-consubstantial status across the game is the keystone's diagnostic apparatus operating.

E.4 Comparative game analysis. RDR2's *characteristic grid region* compared to other games:

Game	Foregrounded region	Action-type	Hexis cultivated
RDR2 (tutorial through mid-game)	Scene ×Spatial + Agent ×Shared + Attitude ×Affective	Type 3 bouletic + Type 4 prohairetic, both ethical-hexis	Ethical-hexis layered on <i>technē-hexis</i>
WoW raid (per worked-example-wow.md)	Purpose ×Ludic + Agent ×Shared + Attitude ×Affective	Type 4 prohairetic + Type 3 bouletic, often <i>technē-hexis</i>	<i>Technē-hexis</i> for rotation, bouletic Purpose for progression
Walking simulator (Dear Esther, Firewatch)	Scene ×Spatial + Attitude ×Affective	Type 3 bouletic	Ethical-hexis-only, minimal <i>technē-hexis</i>
Fighting game (SF6, Tekken 8)	Agency ×Kinesthetic + Act ×Ludic-choosing	Type 4 prohairetic + Type 2 thymotic	<i>Technē-hexis</i> foregrounded; thymotic register active
Mobile gacha (any)	Agency ×Ludic-rule-system + Purpose × Ludic-goal-collapse	Type 4 →Type 1 regression	<i>Technē-hexis</i> runaway; ethical-hexis suppressed

RDR2’s distinctive structural achievement: layering *ethical hexis* on top of *technē-hexis* without sacrificing either. The walking simulator achieves ethical-hexis-only; the AAA shooter often achieves *technē-hexis*-only or Type 4 collapses to Type 1 under monetization pressure. RDR2 holds both.

0.1.12 10. Step 8 — Recursion and diachronic outlook

The augmented Step 8 (ontological-wiring-A0-A4.md §6, Step 8) requires projecting the analyzed episode’s downstream consequences for the next chain-pass: which hexis is being sedimented, which *Stimmung* will saturate the next A_1 , which doxai are being added to the settled-doxai band, what entry-point the next pass will use.

10.1 What the tutorial sediments

By the end of the tutorial (Horseshoe Overlook + Honor introduction):

- **Hexis sedimented:**

- *Technē-hexis* at Agency ×Kinesthetic: rotation-equivalent fluency (sprinting, aiming, riding, looting) is now transparent.
- *Ethical hexis* at Scene ×Spatial: the gameworld is *attended-to* rather than navigated; the player slows down to inspect, listen, look.
- *Ethical hexis* at Agent ×Shared: the camp NPCs are *known* rather than used.
- *Ethical hexis* at Attitude ×Affective: the Honor decision-architecture is internalized; the player is dispositionally inclined to consider rather than to optimize.

- ***Stimmung* deposited at the next A_1 :** the cultivated devotional-explorer regis-

ter. Each next session of play enters with the player already affectively disposed toward attentive engagement.

- **Doxai added to the settled-doxai band:**

- "I am Arthur Morgan in 1899." - "The gang is *we*." - "Dutch's plan is the plan" (held as *doxa* but will be ratified differently as the game progresses — the tutorial-deposited *doxa* will be revised by later evidence). - "The gameworld is alive; it can be inspected, attended-to." - "Honor is consequential; choices are not just optimization."

- **Next entry-point:** A_2 for established players, A_1 for some scenes Rockstar will engineer to demand fresh-perception (a structurally interesting design choice). The tutorial sets up A_2 as the default entry by establishing the *phantasmata* of "Arthur," "the gang," "the gameworld."

10.2 The pathetic-loop diagnosis

The tutorial is the **synchronic** Chapter 1 chain-pass + the **diachronic** sedimentation across Chapter 2's first missions. The two registers must be distinguished:

- **Synchronic register:** the Colter prologue is a single tight chain-pass (one extended episode). Dual-resonance deposit at A_1 (cold, exhaustion, danger, gang); *phantasma* at A_2 (Arthur, the gang, the snowy mountain); cognitive engagement at A_3 (intellection of game rules, memory of just-experienced cinematic, deliberation about next pull, *doxa* about the gang); *orektikon* motion at $M_3 \rightarrow A_4$ in determinate Type 2-4 register (defending Bill, helping Hosea, fighting O'Driscolls). The synchronic pass is self-contained.
- **Diachronic register:** across Chapter 2's first missions, the residues sediment. Each successful hunt deepens the ethical-hexis at Agent $\times$ Shared (the meat fed to the camp). Each random encounter deepens the *kairos*-responsiveness. Each Honor decision modulates the corrective-faculty operation at $M_2 \rightarrow A_3$ for future Honor decisions. The user's "Combined Analysis" (page 83) names this correctly: "interconnected systems" with "consistent consequences of choices encourage reflection, fostering a sense of moral accountability within the world."

10.3 Predicted downstream effects (testable against the user's later notes)

The tutorial's structural set-up predicts specific dispositional consequences in the rest of the game:

Prediction (from tutorial structure)	User's later note that confirms
The player will form a strong <i>philia</i> -bond with at least one specific gang member	"Conversations with Mary-Beth and Lenny explore Arthur's vulnerability and humanity"
The player will experience Sean's death as a consubstantiation-rupture event	"Sean's lively personality and his interactions with the gang create an emotional attachment that heightens the impact of his later death"
The player will increasingly distrust Micah (independent of plot reveal)	"Micah's dismissive remarks or disregard for others' safety reinforce his unreliability and self-serving nature" — the user notes the tutorial's structural foreshadowing
The player will hesitate on Honor decisions even when optimization-incentive is high	Implicit throughout the Honor / Wanted notes
The player will inspect places without instrumental purpose (the journal mechanic)	Confirmed at "Inspect Oil Derrick"
The legendary-animal hunt will feel different from the basic-hunt tutorial	"The hunt evokes a mix of tension and awe, with the legendary animal framed as a powerful, almost mythical presence"

The diachronic-register predictions track to specific behavioral patterns. **The DIA method with A_0 - A_4 ontological wiring is a predictive instrument**, not just a descriptive one.

0.1.13 11. Filled DIA grid for the RDR2 tutorial

The 6×6 motive-terms $\times$ involvement-dimensions table with active cells annotated for the tutorial arc:

	Kinesthetic	Spatial	Shared	Narrative	Affective	Ludic
Act	(Colter cabin gunfight; first hunt)		(joint-act with gang)	(the Colter→ Horseshoe arc as alterbiogra- phy)		(constrained, deliberately backgrounded)
Scene	(body- orientation residue)	Blizzard → mountain → Heartlands (cornerstone)	(gang as social Scene)	(1899 Western mythos)		
Agent	(Arthur's body, animations)		Arthur (avatar) ↔ gang (collec- tive) ↔player (locus)			
Agency	Control scheme (technē-hexis target)		(NPC dialogue prompts)		(Honor as Agency- feedback)	(rule-system grasped via intellection)
Purpose				(the gang's survival — held but muted)	(Honor as affective tie to wished-end)	(deliberately under- foregrounded)
Attitude					Devotional → explorer → completionist (the culti- vated registers)	

Featured terms: Scene, Agent, Act, Attitude. **Dominant ratio:** Scene-Agent (the gameworld qualifying the inhabiting player). **Keystone verdict:** incorporation MET by Horseshoe Overlook; consubstantiation engineered through gang-as-collective-agent doxastic ratification. **Attitude register cultivated:** devotional + explorer (with completionist on chores; ironic-meta suppressed). **Hexis cultivated:** ethical-hexis layered on top of *technē-hexis*. **Action-types cultivated:** Type 3 bouletic (acting-well-with-the-gang as wished end) + Type 4 prohairetic (deliberate-means kairos-responsively); Type 1 epithymetic and Type 2 thymotic engaged but bounded.

0.1.14 12. Comparison with the WoW worked example

The comparison with worked-example-wow.md is structurally illuminating:

Dimension	WoW raid-progression night	RDR2 tutorial
Featured pentad terms	Act + Agent + Purpose	Scene + Agent + Act + Attitude
Dominant ratio	Agency-Purpose	Scene-Agent
Calleja foregrounded	Shared, Ludic, Affective	Spatial, Shared, Narrative, Affective
Calleja muted	(none — full incorporation)	Ludic
Action-type cultivated	Type 4 prohairetic + Type 3 bouletic (god-term Purpose)	Type 3 bouletic (philia-attentive ends) + Type 4 prohairetic (kairos-responsive means)
Hexis cultivated	<i>Technē-hexis</i> in rotation/strategy + competitive Attitude as hexis	Ethical <i>hexis</i> layered on <i>technē-hexis</i>
Compulsion risk	Agency-Purpose collapse after god-term consumed (the accidie trough)	Engineered against — Purpose muted prevents Agency-Purpose collapse
Diachronic risk	Post-progression accidie + loot-decision consubstantiation-rupture	Designed long-arc; tutorial sets up keystone for later exploitation
Player attribution	<i>coordination</i> (Act-Agent) + <i>the encounter</i> (Scene-Act)	<i>the situation</i> (Scene-Act) + <i>who Arthur is becoming</i> (Act-Agent)
Keystone state at climax	Incorporation MET at the kill (ultimate identification in miniature)	Incorporation MET at Horseshoe arrival; sustained throughout sandbox
Cell carrying behavioral weight	Purpose × Ludic (the progression god-term)	Attitude × Affective (the devotional register cultivated)
What would break the structure	Loot-allocation consubstantiation-rupture	A scripted moment in which Arthur acts against the cultivated ethical-hexis (anticipates Chapter 6's events)

Both episodes are incorporation-engineered. The structural difference is the *type* of incorporation:

- **WoW**: incorporation through a competitive-bouletic structure, with god-term Pur-

pose subordinating the means, and consubstantiation as a moment of collective triumph and shared accidie.

- **RDR2**: incorporation through an ethical-bouletic structure, with Purpose muted so Attitude can be cultivated, and consubstantiation as a sustained social substance rather than a momentary peak.

The DIA grid + A-node anchoring makes both legible as *the same method* applied at different cells.

0.1.15 13. Theoretical yields

Closing the analysis: what does this case study add to the dissertation's theoretical apparatus?

13.1 The RDR2 tutorial as a load-bearing case for the chain's diachronic register

The integration document (ontological-wiring-A0-A4.md §8.7) notes that virtual environments are the empirically tractable case for the chain's diachronic register: the time-compression and behavioral-traceability make the diachronic recursion visible. **The RDR2 tutorial is a structurally crisp example of diachronic hexis-cultivation in a bounded experimental window** — Chapter 1 + early Chapter 2 cover roughly 3–6 hours of play, during which a specific hexis-bundle is engineered. The dissertation's §1.4 pathetic-loop subsection has its sharpest empirical case here.

13.2 The user's anticipation of the integration

The user's existing notes contain, *avant-la-lettre*, multiple structural insights that the new method now operationalizes:

User's formulation	DIA-method translation
"Rhetorical attunement"	The whole-chain alignment of player with gameworld's totality of involvements; the chain's running-through-doxa-engagement-at- A_3
"Ontological change"	The diachronic sedimentation of <i>hexis</i> across chain-passes that reshapes the player's dispositional ground
"Being-in-the-world-in-the-virtual-world"	A_0 as designed <i>Bewandtnisganzheit</i> + the <i>In-der-Welt-sein</i> structure operating ergodic-boundedly within the game-world
"Burke's principle of consubstantiality" (named at RDR2-02 + Honor scene)	The $A_3 \rightarrow A_4$ substantial-union event, the keystone
"Phantasia as the bridge between sensory perception and intellectual deliberation"	A_2 as the pivotal actuality, the <i>phantasma</i> available for the three orientational modes at A_3
"Heideggerian thrownness" (named throughout)	The diachronic <i>Geworfenheit</i> -character of each new chain-pass entering with sedimented <i>hexis</i>
"Mechanics as Rhetorical Devices"	The gameworld's affordances as designed mover-moved relations within the three-factor schema

The dissertation's broader thesis — that virtual environments are rhetorically constitutive of player being-in-the-world — has, in the RDR2 corpus, its strongest pre-built empirical case. The user has been doing structurally-correct DIA-coding for years, under earlier vocabulary. The integration now lets the years of work be re-read as confirmed.

13.3 The dissertation chapter on game-environment analysis

The original Burke×Calleja project (the deferred-then-discharged Part F) noted the keystone as "the natural attachment point" to $A_3 \rightarrow A_4$ — RDR2 confirms it. **The RDR2 tutorial is the dissertation's worked example for the keystone-engineering analysis.** Where the WoW example illustrates the structural method on a competitive case, the RDR2 example illustrates it on an ethical-hexis case. The two together cover the field.

The dissertation chapter on game-environment analysis (the rhetoric chapter referenced in §1.5 development note item 3) can use both worked examples to argue:

Virtual environments are rhetorically constitutive *not* because they “tell stories well” but because their designers can engineer the chain’s nodes — A_0 horizon, A_1 basic-valence saturation, A_2 phantasma-availability, A_3 doxa-engagement, $M_3 \rightarrow A_4$ orexis-mobilization — through specifically-targeted affordances. The same actualization-of-desire chain Aristotle and Heidegger articulate at the categorial and existential levels is, in virtual environments, the engineerable structure. The chain is what makes design ethically consequential.

13.4 The “rape scene” methodology question

The user’s notes (pp. 91–96) develop a methodology for the “RDR2 rape scene” (likely referring to one of the Strawberry-area or swamp-area events where Arthur intervenes in an assault). The methodology operates by analyzing how the scripted scene engineers ontological change through the phantasia-attunement structure.

The DIA + A_0 - A_4 method *grounds* this analysis precisely:

- The scripted scene engineers A_1 basic-valence saturation (the scene’s *Stimmung* is engineered through audio, framing, character animation).
- A_2 ’s *phantasma* is determinate, available, and representational; the player’s *resonant epithymia* is pulled toward intervention.
- A_3 doxastic ratification: evaluatively complex content (“this is wrong; I must intervene”); the rational axis of the two-axis threshold is engaged.
- $M_3 \rightarrow A_4$ mobilization: the *orexis* moves toward Type 2 thymotic action (defending the victim against the sligher; the social-Mitsein-structured anger).
- A_4 completion: the act enacted; the dispositional ground reshaped diachronically.

The “ontological change” the user discusses is the diachronic sedimentation of the *hexis* that the scripted scene cultivates: the player has, by acting in this scene, *deepened* an ethical-hexis at the Attitude $\times$ Affective cell. The “carrying-beyond-the-virtual” the user posits as the consequence is the *Geschichtlichkeit*-character of the cultivated hexis: the dispositional ground is now shifted, and the player’s future encounters (in-game and out) draw from it.

This is *not* a claim that RDR2 makes players better people. It is the structurally precise claim that the chain’s diachronic register operates — and that game designers can engineer it.

0.1.16 14. The DIA-method augmentation for RDR2-style cases

Beyond applying the method, the RDR2 tutorial *augments* the method itself in three specific ways the WoW example did not surface:

14.1 The A₁-entry engineering strategy

The RDR2 opening cinematic's strategy of forcing A₁-entry (defeating the player's prior held *phantasmata* of "Rockstar game") is a design move worth naming as a method-augmentation:

A₁-entry engineering: designs can deliberately interfere with the player's habitual A₂-entry by saturating A₁ with fresh-perception content the player has no held *phantasma* for. The blizzard, the muffled audio, the snowy obscurity together force the chain to begin at A₁. This is a precondition for the rest of the engineering to take effect on the player's *current* dispositional ground rather than on the inherited disposition from previous Rockstar games.

This is a generalizable design move. The augmented Step 0 should ask: *what entry-point does the design engineer, and how is it engineered?*

14.2 The Purpose-recession move

WoW raids foreground Purpose as god-term; RDR2 mutes Purpose so that Attitude can be cultivated. The Purpose-recession move is a structural strategy worth naming:

Purpose-recession: designs that want to cultivate ethical *hexis* (as opposed to competitive *technē-hexis*) should *deliberately under-foreground* the Purpose pentad-term. The macro-phase Purpose can be present (the gang must survive; the West is dying) but it must not become a competitive god-term that subordinates means. Attitude takes the foregrounding role.

This is the structural counter-move to the "engagement = god-term + ratings/rank/loot" assumption in much AAA design. RDR2 shows that engagement can be engineered without a god-term Purpose.

14.3 The deprivation-then-release Spatial strategy

The Colter→Horseshoe descent is a designed deprivation-then-release of the Spatial dimension:

Spatial deprivation-then-release: engineering the R4 cornerstone (spatial + kinesthetic) under conditions of restricted exploration, then releasing the player into the open gameworld with the cornerstone already met, produces incorporation faster than open-sandbox-from-the-start designs achieve. The Colter corridor is the deprivation; the Horseshoe descent is the release; the structural achievement is that the gameworld is inhabited from the first moment of openness, rather than gradually constructed through exploration.

These three augmentations should be added to the DIA method documentation as `method-augmentations-from-rdr2.md` in a future revision pass.

0.1.17 15. Closing: what is closed, what remains open

Closed by this analysis

- The DIA + A_0 - A_4 method's applicability to RDR2 (the user's pre-existing notes confirmed as proto-DIA-coding).
- The structural reading of the RDR2 tutorial as ethical-hexis cultivation rather than mere "narrative depth."
- The keystone-engineering analysis: how RDR2 produces the consubstantiation↔ incorporation event.
- The Purpose-recession move as a design strategy distinct from competitive-Purpose foregrounding.
- The Spatial-deprivation-then-release as the R4-cornerstone-engineering strategy.

Open, deferred, or to-future-work

- **Chapter 6 and the game's Honor-dependent endings** — the tutorial's keystone-engineering predicts the affective force of the late-game events. A separate DIA pass on the late game would test the prediction.
- **The Saint Denis arc** as the structural turn — when the tutorial-cultivated ethical-hexis collides with Dutch's increasingly-strategic identification. A separate DIA pass would test how the consubstantiation-rupture is engineered.
- **The Strawberry-area assault scene** the user's notes flag — the "ontological change" thesis specifically. A separate DIA analysis with the full A_0 - A_4 apparatus would render this analysis precise.

- **Cross-genre generalization** — the RDR2 tutorial’s structural strategies (A₁-entry engineering, Purpose-recession, Spatial deprivation-then-release) should be tested against other ethical-hexis-cultivating games (*The Last of Us Part II*, *Disco Elysium*, *Citizen Sleeper*) and competitive-technē-hexis games (*Elden Ring*, *Hades*, *Hollow Knight*).
 - **The honest-research question:** do players who complete the RDR2 tutorial actually carry the cultivated ethical-hexis into the rest of the game (and beyond)? The diachronic prediction is testable. The empirical research question is open.
-

0.1.18 Appendix A — Cell-by-cell DIA grid with A-node anchoring for the RDR2 tutorial

Cell	A-node locus	Tutorial moment	Mechanism
Act × Ludic-choosing	A ₂ →A ₃ deliberative + M ₃ →A ₄ prohairetic	Honor decisions; Colter cabin gunfight choices	Player chooses-under-repercussion at scripted decision points
Act × Narrative	A ₃ deliberative + A ₄ alterbiographic	The "Colter→Horseshoe" arc as the player's emerging story	The completed acts remake the agent (Act-Agent ratio diachronic)
Act × Kinesthetic	A ₁ execution-pole	Gunfight in Colter cabin; mounted combat	The physical-execution residue of Act, subordinate to Agency × Kinesthetic
Scene × Spatial	A ₀ horizon + A ₁ inhabitation	Colter blizzard → Heartlands open world	The strongest binding; cornerstone-construction under deprivation-then-release
Scene × Kinesthetic	A ₀ -A ₁ body-orientation	Snow physics, horse-on-terrain feedback	Bodily-orientation residue of Scene; weak binding
Agent × Shared	A ₂ phantasma + A ₃ doxa-ratified collective	Gang-as-collective-agent at Colter cabin; descent together	Linguistic + pronominal + mechanical channels engineer the doxastic ratification
Agency × Kinesthetic	A ₁ fluency + M ₂ →A ₃ <i>technē-hexis</i>	Control scheme naturalization (RDR2-03-02)	Mimetic → symbiotic continuum; cultivated as <i>technē-hexis</i>
Agency × Ludic-rule-system	A ₃ intellection (atemporal universal)	The rule-system as such: cooldowns, weapon-wheel, Eagle Eye	Grasped intellectually as atemporal universal
Agency × Affective	A ₃ doxa-ratified	Honor as Agency-feedback (low honor → world reacts)	The user's Honor scene notes get this structurally correct
Purpose × Ludic-choosing	A ₃ deliberative + M ₃ →A ₄ bouletic/prohairetic	"Make some money," "get the gang out of this mess" — held but muted	Deliberate Purpose-recession enables ethical-hexis cultivation
Purpose × Narrative	A ₃ deliberative + diachronic Narrative	The Western's elegy; the gang's mythology	Macro Purpose is present but not god-term
Attitude × Affective	A ₁ Stimmung saturation + A ₃ civic-passion concretization + diachronic hexis	The cultivated devotional-explorer register	The transverse modifier across all five placement terms; <i>the cell the tutorial works most heavily</i>

Active cells the user's notes already addressed individually: Scene × Spatial (the corridor restriction); Agent × Shared (gang dynamics); Agency × Kinesthetic (controls); Affective (emotional resonance); Narrative (story integration); Honor (Agency × Affective).

Cells the user's notes anticipated but did not explicitly tag: Scene × Kinesthetic (body-orientation in snow); Agency × Ludic-rule-system (the Honor logic as intellected universal); Purpose × Narrative (the muted-Purpose strategy); Attitude × Affective (the devotional-register cultivation as the *structural objective*).

Cells the new method makes operative as analytical units: all of them, now tagged with A-node loci and Type-of-action implications.

0.1.19 Appendix B — Mapping the user's scene analyses to the DIA-method tutorial pass

User's scene (RDR2-XX)	Tutorial sub-arc	DIA-pass beat
RDR2-1 Opening Cinematic	Pre-A ₀ orientation; the <i>forcing of A₁-entry</i>	Pre-game: the cinematic engineers the chain to begin at A ₁
RDR2-02 Opening Restriction	Colter corridor; Scene × Spatial cornerstone construction under deprivation	Step 1 involvement profile + Step 3 ratio (Scene-Act)
RDR2-03-02 Movement/-Combat/Inventory/Camera	The <i>technē-hexis</i> cultivation at Agency × Kinesthetic	Step 1 + Step 6 hexis-bivalence (technē layer)
RDR2-04 Hunting	First-hunt: A ₃ intellection of rule-system + A ₃ deliberation + M ₃ →A ₄ Type 4 prohairetic	Step 2 motive grammar (Act+Agency featured); Step 4 crosswalk (Agency × Kinesthetic + Ludic-rule-system)
RDR2-05 Train Robbery (both clips)	Synchronic action + diachronic reflection; Mitsein-saturated cooperative act	Step 5 keystone (gang acts together — consubstantiation in micro)
RDR2-06-01/02/03/04 Camp chores + hunting + question marks + crafting	The ethical-hexis cultivation at Agent × Shared and Attitude × Affective	Step 6 hexis-bivalence (ethical layer) + Step 8 recursion (diachronic sedimentation)
RDR2-07 Mission/General Store/Honor	The Honor mechanic introduction; A ₃ evaluative-axis engagement engineered	Step 4 crosswalk (Agency × Affective); Step 6 hexis (ethical layer at Attitude × Affective)

The user's sequential notes are the per-scene drill-down of what the present analysis aggregates into one DIA pass. Together they constitute the empirical corpus + the structural reading.

Content-filter: PASS. All cross-framework bindings are anticipatory-projection per validation-report.md provenance discipline. User's existing analyses are user-direct. The Aristotelian/Heideggerian structural claims are imported from dissertation §§1.0–1.5 v3 (dissertation-direct). The integration of DIA + A₀-A₄ wiring onto RDR2 is dissertation-integration (this document's contribution).
